**Introduction**

Lipid peroxidation is a well-defined mechanism of cellular damage in animals and plants. Lipid peroxides are unstable indicators of oxidative stress in cells that decompose to form more complex and reactive compounds such as Malondialdehyde (MDA) and 4-hydroxynonenal (4-HNE), natural bi-products of lipid peroxidation. Oxidative modification of lipids can be induced \textit{in vitro} by a wide array of pro-oxidant agents and occurs \textit{in vivo} during aging and in certain disease conditions. Measuring the end products of lipid peroxidation is one of the most widely accepted assays for oxidative damage. These aldehydic secondary products of lipid peroxidation are generally accepted markers of oxidative stress.

Both MDA and HNE have been shown to be capable of binding to proteins and forming stable adducts, also termed advanced lipid peroxidation end products. These modifications of proteins by MDA or HNE can cause both structural and functional changes of oxidized proteins.

The OxiSelect™ MDA Adduct ELISA Kit is an enzyme immunoassay developed for rapid detection and quantitation of MDA-protein adducts. The quantity of MDA adduct in protein samples is determined by comparing its absorbance with that of a known MDA-BSA standard curve. The kit has detection sensitivity limit of 2 pmol/mg MDA adduct. Each kit provides sufficient reagents to perform up to 96 assays, including standard curve and unknown protein samples.

**Assay Principle**

BSA standards or protein samples (10 µg/mL) are adsorbed onto a 96-well plate for 2 hrs at 37°C. The MDA-protein adducts present in the sample or standard are probed with an anti-MDA antibody, followed by an HRP conjugated secondary antibody. The MDA protein adducts content in an unknown sample is determined by comparing with a standard curve that is prepared from predetermined MDA-BSA standards.

Kit Components

Box 1 (shipped at room temperature)
1. 96-well Protein Binding Plate (Part No. 231001): One strip well 96-well plate.
2. Anti-MDA Antibody (1000X) (Part No. 233201): One 20 µL vial of anti-MDA Rabbit IgG.
4. Assay Diluent (Part No. 310804): One 50 mL bottle.
5. 10X Wash Buffer (Part No. 310806): One 100 mL bottle.
6. Substrate Solution (Part No. 310807): One 12 mL amber bottle.
7. Stop Solution (Part. No. 310808): One 12 mL bottle.
8. Reduced BSA Standard (Part No. 233202): One 500 µL vial of 1 mg/mL reduced BSA in PBS.

Box 2 (shipped on blue ice packs)
1. MDA-BSA Standard (Part No. 233203): One 20 µL vial of 1 mg/mL MDA-BSA in PBS at 2.4 µmol MDA/mg proteins. The amount of MDA adduct is predetermined by a TBARS assay kit (Cat# STA-330).

Materials Not Supplied
1. Protein samples such as purified protein, plasma, serum, cell lysate
2. 1X PBS
3. 10 µL to 1000 µL adjustable single channel micropipettes with disposable tips
4. 50 µL to 300 µL adjustable multichannel micropipette with disposable tips
5. Multichannel micropipette reservoir
6. Microplate reader capable of reading at 450 nm (620 nm as optional reference wave length)

Storage
Upon receipt, aliquot and store the Reduced BSA and MDA-BSA Standards at -20ºC to avoid multiple freeze/thaw cycles. Store all other kit components at 4ºC until their expiration dates.

Preparation of Reagents
• 1X Wash Buffer: Dilute the 10X Wash Buffer Concentrate to 1X with deionized water. Stir to homogeneity.
• Anti-MDA Antibody and Secondary Antibody: Immediately before use dilute the Anti-MDA antibody 1:1000 and Secondary Antibody 1:1000 with Assay Diluent. Do not store diluted solutions.
Preparation of Standard Curve

1. Freshly prepare 10 μg/mL of Reduced BSA by diluting the 1 mg/mL BSA standard in 1X PBS. Example: Add 50 μL to 4.95 mL of 1X PBS.

2. Freshly prepare 0.5 μg/mL of MDA-BSA by diluting the 1 mg/mL MDA-BSA standard in 10 μg/mL of Reduced BSA. Example: Add 2 μL to 4.0 mL of 10 μg/mL Reduced BSA.

3. Prepare a series of MDA-BSA standards according to Table 1.

Assay Protocol

Important Note: MDA protein adducts are not stable long term. We recommend that all samples be tested fresh or after freezing at -80ºC for no more than one month.

1. Dilute unknown protein sample to 10 μg/mL in 1X PBS. Each protein sample and MDA-BSA Standard should be assayed in duplicate or triplicate.

2. Add 100 μL of the 10 μg/mL protein samples or Reduced/MDA-BSA standards to the 96-well Protein Binding Plate. Incubate at 37ºC for at least 2 hours or 4ºC overnight.

Note: Lysate sample should not be prepared in lysis buffer containing Triton X-100, NP-40, or Igepal CA-630 because these detergents interfere with protein coating of the plate unless the detergent concentration in the 10 μg/mL protein samples is no more than 0.001%. We recommend lysis by homogenization or sonication.

3. Wash wells 2 times with 250 μL 1X PBS per well. After the last wash, empty wells and tap microwell strips on absorbent pad or paper towel to remove excess wash solution.

4. Add 200 μL of Assay Diluent per well and incubate for 1-2 hours at room temperature on an orbital shaker.

5. Wash 3 times with 250 μL of 1X Wash Buffer with thorough aspiration between each wash. After the last wash, empty wells and tap microwell strips on absorbent pad or paper towel to remove excess 1X Wash Buffer.

6. Add 100 μL of the diluted anti-MDA antibody to all wells and incubate for 1 hour at room temperature on an orbital shaker. Wash the strip wells 3 times according to step 5 above.
7. Add 100 µL of the diluted Secondary Antibody-HRP conjugate to all wells and incubate for 1 hour at room temperature on an orbital shaker. Wash the strip wells 5 times according to step 5 above.

8. Warm Substrate Solution to room temperature. Add 100 µL of Substrate Solution to each well, including the blank wells. Incubate at room temperature on an orbital shaker. Actual incubation time may vary from 2-30 minutes.

   Note: Watch plate carefully; if color changes rapidly, the reaction may need to be stopped sooner to prevent saturation.

9. Stop the enzyme reaction by adding 100 µL of Stop Solution to each well. Results should be read immediately (color will fade over time).

10. Read absorbance of each well on a microplate reader using 450 nm as the primary wave length. Use the Reduced BSA Standard as an absorbance blank.

**Example of Results**
The following figures demonstrate typical MDA Adduct ELISA results. One should use the data below for reference only. This data should not be used to interpret actual results.
